

Employee Analytics Dashboard (Power BI)

Project Summary:

This project follows an end-to-end data analysis workflow. The dataset was initially taken in Excel and then converted into SQL for better data handling and querying. SQL was used to clean the data and extract useful insights. After that, the processed data was imported into Power BI to build an interactive dashboard.

Dashboard Pages and Analysis:

1. Overview Page:

This page provides a high-level summary of the dataset. Key performance indicators (KPIs) such as total employees, average salary, and overall insights are displayed using card visuals.

2. Salary Analysis Page:

This page focuses on salary-related insights. A Top 10 highest paid employees table is created using filtering techniques. Salary is also converted into LPA (Lakhs Per Annum) for better readability.

3. Performance Analysis Page:

This page highlights employee performance. Top 10 performers are identified based on performance score. Department-wise performance comparison is also shown using bar charts.

4. Location Analysis Page:

This page shows the distribution of employees based on city. A map visual is used along with bar charts and tables to compare employee count across cities.

5. Trends Analysis Page:

This page focuses on trends over time. A Year column is created to analyze hiring trends and salary trends. Line charts show changes over time, and a scatter chart shows the relationship between experience and salary.

Tools and Technologies Used:

Excel, SQL, Power BI, DAX

Key Insights:

- Top 10 highest paid employees
- Performance comparison across departments
- City-wise employee distribution
- Hiring and salary trends
- Experience vs Salary relationship

Conclusion:

This dashboard provides meaningful insights and demonstrates the complete data analysis lifecycle from raw data to visualization.
